Example #3 - Solving with Square Roots

$\sqrt{x} = 2.4$

<p>Step 1 Rewrite each decimal as a fraction.</p>	<p>$2\frac{4}{10}$ * make it an improper fraction $= \frac{24}{10}$</p>
<p>Step 2 Square the value. <i>Square is the inverse of Square root</i></p>	<p>$\left(\frac{24}{10}\right)^2 = \frac{24}{10} \cdot \frac{24}{10} = \frac{576}{100}$</p>
<p>Step 3 Record the answer using proper notation.</p>	<p>$\frac{576}{100}$ $X = 5.76$</p>

* IF it starts as a decimal, the answer should be a decimal.

* IF it starts as a fraction, the answer should be a fraction.

① $\frac{\sqrt{x} = 4}{\frac{4}{1}}$

② $\left(\frac{4}{1}\right)^2 = \frac{4}{1} \cdot \frac{4}{1} = \frac{16}{1}$

③ $X = 16$

① $\frac{\sqrt{x} = 0.49}{\frac{49}{100}}$

② $\left(\frac{49}{100}\right)^2 = \frac{49}{100} \cdot \frac{49}{100} = \frac{2401}{10,000}$

③ $X = .2401$

Handwritten multiplication: $49 \times 49 = 2401$

$\frac{\sqrt{x} = \frac{3}{8}}$

① $\frac{3}{8}$

② $\left(\frac{3}{8}\right)^2 = \frac{3}{8} \cdot \frac{3}{8} = \frac{9}{64}$

③ $X = \frac{9}{64}$

Example #4 - Solving with Perfect Squares

$$x^2 = .25$$

$$x^2 = 16$$

4, -4
2 solutions

<p>Step 1 Read the number mathematically and write the decimal as a FRACTION.</p>	$\frac{25}{100}$
<p>Step 2 Take the Square Root of the fraction.</p>	$\sqrt{\frac{25}{100}} = \frac{\sqrt{25}}{\sqrt{100}} = \frac{5}{10}$
<p>Step 3 Record the answer using proper notation (REMEMBER: 2 Solutions).</p>	$\frac{5}{10} = 0.5 \quad \boxed{X = \pm 0.5}$

*IF x^2 , then there are 2 solutions.

Make a mixed number or improper fraction

$$x^2 = 6.25$$

① ~~$\frac{625}{100}$~~ $6\frac{25}{100} = \frac{625}{100}$

② $\sqrt{\frac{625}{100}} = \frac{\sqrt{625}}{\sqrt{100}} = \frac{25}{10}$

③ $\frac{25}{10} = 2.5 \quad \boxed{X = \pm 2.5}$

$$x^2 = -3$$

① $\frac{-3}{1}$

② $\sqrt{\frac{-3}{1}} = \frac{\sqrt{-3}}{\sqrt{1}}$

③ \emptyset No solution

Can't take the square root of a negative number
